Abstract- **Counterfeit products have become a major issue in the global market, causing significant economic losses to businesses and health and safety risks to consumers. Blockchain technology has the potential to address this problem by creating a secure and immutable record of the origin and movement of products. This paper explores the use of blockchain technology for identifying counterfeit products. We examine the characteristics of blockchain technology, its benefits, and limitations. We also discuss the current approaches used for product identification and how blockchain technology can be used to enhance these methods. We present a case study on how blockchain technology can be implemented to identify counterfeit pharmaceuticals, one of the most critical areas of concern. The results show that blockchain technology can be a useful tool in identifying counterfeit products, as it provides an immutable record of product provenance, enhances traceability, and reduces the risk of fraud.**

Keywords: Blockchain; Counterfeit products; Ownership code; Supply chain.

1.INTRODUCTION

Counterfeit products pose significant risks to businesses, consumers, and economies globally. Counterfeit products not only cause financial losses to businesses but also pose significant health and safety risks to consumers. The traditional methods of product identification, [1]such as holograms, watermarks, and serial numbers, are becoming less effective as counterfeiters become more sophisticated. The need for more advanced and secure methods of product identification has become a top priority for businesses and governments worldwide.

1.1 Blockchain technology

Blockchain Technology which provides a distributed and immutable record of transactions, is increasingly being considered as a solution to address the issue of counterfeit products. The blockchain can provide a secure and transparent record of the product's origin, movement, and ownership.[2] In this paper, we explore how blockchain technology can be used to identify counterfeit products, with a specific focus on pharmaceuticals.

1.1.1Characteristics of Blockchain Technology:

Blockchain technology is a decentralized, distributed ledger that records and verifies transactions through a network of computers. The characteristics of

blockchain technology that make it suitable for product identification include:

Decentralization: Blockchain technology is a decentralized system, which means that there is no central authority that controls the data. This means that the data is more secure and less prone to hacking.

Transparency: The blockchain is a transparent system, meaning that all transactions are visible to all participants. This transparency can be used to verify the authenticity of products and trace their origin.

Immutability: Data cannot be changed or removed after it has been stored on the blockchain. This feature makes the data more dependable by ensuring its integrity.

Security: The blockchain uses advanced cryptography to secure transactions and prevent fraud.

1.1.2 Benefits of Using Blockchain Technology for Product Identification:

The use of blockchain technology for product identification has several benefits, including:

Enhanced traceability: The blockchain can provide a complete and transparent record of the product's journey from the manufacturer to the end consumer. This information can be used to verify the authenticity of the product and trace its origin.

Improved supply chain management: In order to improve supply chain management, blockchain technology can be used to track the movement of items, lessen administrative burdens, and boost productivity.

Reduced counterfeiting: The immutable record provided by the blockchain can help prevent counterfeiting by verifying the authenticity of products.

Increased consumer confidence: Consumers can be more confident about the authenticity of the products they purchase, which can increase their trust in the brand.

1.1.3 Limitations of Using Blockchain Technology for Product Identification:

While the use of blockchain technology for product identification has several benefits, it also has some limitations, including:

High cost: Implementing blockchain technology can be expensive, especially for small and medium-sized businesses.

Limited scalability: The blockchain is limited in its ability to process transactions, which can limit its scalability.

Limited adoption: The use of blockchain technology is still in its early stages, and many businesses and consumers are not yet familiar with the technology.

2.Literature Survey:

The detection of fake goods has grown into a significant problem in recent years. The global value of counterfeiting has reportedly hit $1.2 trillion, according to the Global Brand Counterfeiting Report 2018. The reputation of a brand can be seriously harmed by counterfeiting, and it can also result in financial loss and even put public health and safety at risk. It has become apparent that using blockchain technology could be a way to stop counterfeiting. [3] The distributed ledger technology known as blockchain offers a safe and open way to store transactional data. This essay does a review of the literature on the use of blockchain technology to detect fake goods.

Blockchain technology has been proposed as a potential solution to identify and track counterfeit products. Several studies have proposed various blockchain-based solutions for the identification of counterfeit products.

One study proposed a blockchain-based solution for identifying counterfeit drugs. The solution uses blockchain technology to track the supply chain of pharmaceutical products.[4] The blockchain is used to record the movement of drugs from the manufacturer to the end consumer. The solution also includes a mobile application that allows consumers to scan the drug's barcode and verify its authenticity. The study concludes that the blockchain-based solution can effectively identify counterfeit drugs and prevent their circulation in the market.

Another study proposed a blockchain-based solution for identifying counterfeit luxury goods.[5]The solution uses blockchain technology to record the entire supply chain of luxury goods. The blockchain is used to track the movement of goods from the manufacturer to the end consumer. The solution also

includes a mobile application that allows consumers to scan the product's barcode and verify its authenticity. The study concludes that the blockchain-based solution can effectively identify counterfeit luxury goods and prevent their circulation in the market.

A study proposed a blockchain-based solution for identifying counterfeit food products. The solution uses blockchain technology to track the entire supply chain of food products.[6] The blockchain is used to record the movement of food products from the farmer to the end consumer. The solution also includes a mobile application that allows consumers to scan the product's barcode and verify its authenticity. The study concludes that the blockchain-based solution can effectively identify counterfeit food products and prevent their circulation in the market.

Another study proposed a blockchain-based solution for identifying counterfeit electronics products.[7] The solution uses blockchain technology to track the entire supply chain of electronics products. The blockchain is used to record the movement of electronics products from the manufacturer to the end consumer. The solution also includes a mobile application that allows consumers to scan the product's barcode and verify its authenticity. The study concludes that the blockchain-based solution can effectively identify counterfeit electronics products and prevent their circulation in the market.

3.Related Work:

Blockchain technology has been proposed as a potential solution for identifying counterfeit products due to its ability to create an immutable and transparent record of transactions. Here are some examples of related work in this area:

1."Blockchain for supply chain traceability: A case study of mango export from India" by Sangeeta Sharma and Sanjay Kumar Dhurandher (2019): This paper presents a case study on using blockchain technology for traceability of mango exports from India to Japan. The authors suggest a blockchain-based system that tracks the movement of mangoes through the supply chain using QR codes, allowing customers to confirm the product's legitimacy.

2."Blockchain-based anti-counterfeiting in fashion and luxury industry" by Zhengyuan Xu, Shanyu Tang, and Zibin Zheng (2019): This paper proposes a blockchain-based system for the fashion and luxury industry to combat counterfeiting. The system uses a unique identifier for each product that is recorded on the blockchain, allowing consumers to verify the authenticity of the product using a smartphone app.

3. "A blockchain-based approach to combating counterfeit drugs" by Michael E. Porter, Jr. and Pinar Ozcan (2018): This paper proposes a blockchain-based system for tracking pharmaceuticals through the supply chain to prevent counterfeit drugs from entering the market. The system uses a unique identifier for each drug that is recorded on the blockchain, enabling consumers to verify the authenticity of the product.

4."Blockchain for anti-counterfeiting in pharmaceutical industry" by Jiaqi Li, Xiaomin Liu, and Weiqi Dai (2020): This paper proposes a blockchain-based system for the pharmaceutical industry to prevent counterfeit drugs from entering the market. The system uses a unique identifier for each drug that is recorded on the blockchain, and it also includes a smart contract that ensures the authenticity of the product.

5. "Blockchain for anti-counterfeiting in wine industry" by Rui Zhang, Xuehui Liu, and Jianqiang Zhang (2019): This paper proposes a blockchain-based system for the wine industry to prevent counterfeiting. The system uses a unique identifier for each bottle of wine that is recorded on the blockchain, enabling consumers to verify the authenticity of the product using a smartphone app.

Overall, these studies demonstrate the potential of blockchain technology for identifying counterfeit products across a range of industries. However, there is still much work to be done in developing and implementing effective blockchain-based systems for anti-counterfeiting.

4.Proposed Framework:

Here is a proposed framework for identifying counterfeit products using blockchain technology:

1.Product identification: Each product is assigned a unique identifier that is recorded on the blockchain. This identifier could be a QR code, a barcode, or an RFID tag.

2. Supply chain tracking: The movement of the product through the supply chain is recorded on the blockchain. This includes information such as the

date of manufacture, the location of each step in the supply chain, and the identity of the parties involved in each step.

3.Authentication: Consumers can use a smartphone app or other device to scan the product identifier and verify its authenticity. The app would access the blockchain to retrieve the information recorded during the supply chain tracking phase and use this information to verify the product's authenticity.

4. Anti-counterfeiting measures: The system can include additional measures to prevent counterfeiting, such as tamper-evident packaging or specialized tags that are difficult to replicate.

5.Enforcement: In cases where counterfeit products are identified, the blockchain can be used to track the source of the counterfeit and help enforce legal action against those involved in the production and distribution of counterfeit products.

This framework would require collaboration between producers, distributors, and retailers to ensure that all relevant information is recorded on the blockchain. It would also require the development of consumer-facing apps or devices that can easily access the blockchain and authenticate products. Additionally, there would need to be legal mechanisms in place to enforce the identification and punishment of counterfeiters.

5. System Architecture:

Here is a possible architecture for a blockchain-based system for identifying counterfeit products:

1.Front-end applications: These are the applications used by consumers to authenticate products. The applications could be mobile apps, web apps, or other devices that can scan the unique identifier on the product and access the blockchain to retrieve information about the product's origin, history, and authenticity.

2. Smart contract: With a smart contract, the conditions of the agreement between the buyer and seller are directly encoded into lines of code, making it a self-executing contract. To make sure that all stakeholders in the supply chain abide by the system's rules and regulations in this design, a smart contract could be employed. The smart contract may, for instance, specify the kind of data that must be entered into the blockchain at each stage of the supply chain. **3.Blockchain network:** The blockchain network is

where all the information about the product is stored in an immutable and transparent ledger. The blockchain could be a public blockchain or a private blockchain, depending on the requirements of the system. The blockchain could be implemented using any of the available blockchain technologies such as Ethereum, Hyperledger Fabric, Corda, etc.

4. IoT sensors: IoT sensors that might be used to monitor the product's progress through the supply chain could potentially be incorporated into the system. The sensors may keep track of data like location, temperature, and humidity and store it on the blockchain.

5. Data analytics and reporting: The system could include data analytics and reporting tools that could be used to analyze the data recorded on the blockchain. This could include identifying patterns in the movement of products, identifying potential counterfeiting hotspots, and generating reports on the system's performance.

Overall, this architecture is designed to ensure that all relevant information about the product is recorded on the blockchain and is accessible to consumers, producers, and regulators. By using smart contracts and IoT sensors, the system could help ensure that all parties in the supply chain comply with the system's rules and regulations, and provide consumers with a high level of confidence in the authenticity of the products they purchase.
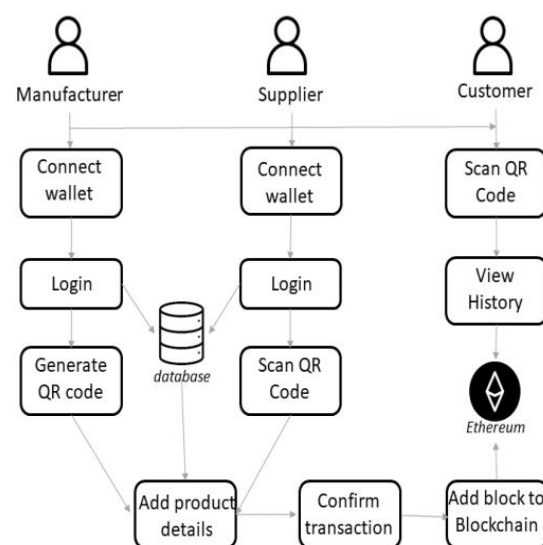

Fig[1] Architecture Supply Chain

Manufacture: A block is added to the Ethereum blockchain using the manufacturer's Ethereum wallet after logging into the manufacturer account to create

a QR code for the product and add any further information that is necessary. If both are present, a connection will be made between the wallet addresses of the entity and the user of our local database. If just the block is published to the digital ledger, the manufacturer will enter data from his own account and wallet.

Supplier: After entering into their account as a supplier, the product's QR code is scanned by the supplier. The manufacturer's entered product information is available to the seller. It injects extra information about the item—like the shop's location—into the Blockchain. These details are visible to the buyer.

Customer: Customers can scan a QR code that details the history of transactions and enables them to examine the integrity of a product to confirm its authenticity. The client will be aware that the goods are not genuine if the final location is different from the purchase location at the time of the customer's purchase following the QR scan in the supply chain history. After learning about counterfeiting, the purchaser comes to the conclusion that the QR code was stolen.

QR Code:

QR codes can be used as a unique identifier for products in a blockchain-based system for identifying counterfeit products. Here is how it could work:

1.Assign a unique QR code to each product: Each product is assigned a unique QR code that is printed on the product or its packaging.

2. Register the QR code on the blockchain: The date of manufacture, the location of each step in the supply chain, and the identities of the parties involved in each step are all stored on the blockchain along with the QR code.

3.Authenticate the product using the QR code: Consumers can use a smartphone app to scan the QR code and authenticate the product. The app would access the blockchain to retrieve the information recorded during the supply chain tracking phase and use this information to verify the product's authenticity.

4.Anti-counterfeiting measures: The system can include additional measures to prevent counterfeiting, such as tamper-evident packaging or specialized QR codes that are difficult to replicate.

5.Enforcement: In cases where counterfeit products are identified, the blockchain can be used to track the source of the counterfeit and help enforce legal action against those involved in the production and distribution of counterfeit products.

Using QR codes in a blockchain-based system for identifying counterfeit products can provide a quick and easy way for consumers to authenticate products. It also allows for the efficient recording and tracking of product information on the blockchain, which can be used to enforce anti-counterfeiting measures and identify the source of counterfeit products.

6. SCM AND BLOCKCHAIN TECHNOLOGY

Supply chain management (SCM) and blockchain technology can work together in a system for identifying counterfeit products.[8] Here is how they could be integrated:

1. Record the supply chain on the blockchain: The movement of the product through the supply chain is recorded on the blockchain, including information such as the date of manufacture, the location of each step in the supply chain, and the identity of the parties involved in each step.

2.Ensure transparency and traceability: By recording the supply chain on the blockchain, the system can provide transparency and traceability, allowing all parties involved in the supply chain to access the same information.

3.Use smart contracts to enforce rules and regulations: Smart contracts can be used to ensure that all parties involved in the supply chain comply with the rules and regulations of the system. For example, the smart contract could specify the type of information that needs to be recorded on the blockchain at each step of the supply chain.

4.Authenticate products using blockchain technology: Consumers can use a smartphone app to scan a unique identifier on the product and access the blockchain to retrieve information about the product's origin, history, and authenticity.

5.Use data analytics to identify potential counterfeiting hotspots: The system can include data analytics tools that can analyze the data recorded on

the blockchain to identify patterns in the movement of products and potential counterfeiting hotspots.

The system can offer a high level of transparency and traceability throughout the supply chain by merging SCM and blockchain technology, making it simpler to find the source of counterfeit goods. [9] A proactive approach can be taken to stop counterfeit goods from entering the supply chain by using data analytics to detect possible counterfeiting hotspots and smart contracts to ensure that all stakeholders in the supply chain abide by the system's rules and regulations.

8.Conclusion and Future Work:

A blockchain-based system for identifying counterfeit products can provide a high level of transparency, traceability, and security throughout the supply chain. By recording information about the product's origin, history, and authenticity on an immutable and transparent ledger, consumers can easily authenticate products using a smartphone app, increasing their confidence in the products they purchase. The use of smart contracts and IoT sensors can also help ensure that all parties in the supply chain comply with the system's rules and regulations, preventing counterfeit products from entering the supply chain.

In conclusion, supply chain management and consumer protection may be completely transformed if blockchain technology is used to combat fake

goods. By offering a trustworthy, secure, and distributed mechanism for tracking and certifying goods, blockchain can help reduce the prevalence of counterfeit products and increase consumer trust. However, implementing such a system requires collaboration among various stakeholders, including producers, retailers, regulators, and consumers, to ensure the system's success. Further research and development are needed to address the technical, social, and economic challenges of implementing a blockchain-based system for identifying counterfeit products.
